

University of Colorado, Boulder

This article raises some questions about the usefulness of meta-analysis as a means of reviewing quantitative research in the social sciences. When a meta-analytic model for SAT coaching is used to predict results from future studies, the amount of prediction error is quite large. Interpretations of meta-analytic regressions and quantifications of program and study characteristics are shown to be equivocal. The match between the assumptions of the meta-analytic model and the data from SAT coaching studies is not good, making statistical inferences problematic. Researcher subjectivity is no less problematic in the context of a meta-analysis than in a narrative review.

Keywords: meta-analysis; literature review; SAT coaching; statistical inference

A : \mathbf{Q} : The author thanks David Freedman and Lorrie Shepard for helpful comments on earlier versions of this article.
